Standard Tries

- ▶ The standard trie for a set of strings S is an ordered tree such that:
 - Each node but the root is labeled with a character
 - The children of a node are alphabetically ordered
 - The paths from the external nodes to the root yield the strings of S
- Example: standard trie for the set of strings

S = { bear, bell, bid, bull, buy, sell, stock, stop }

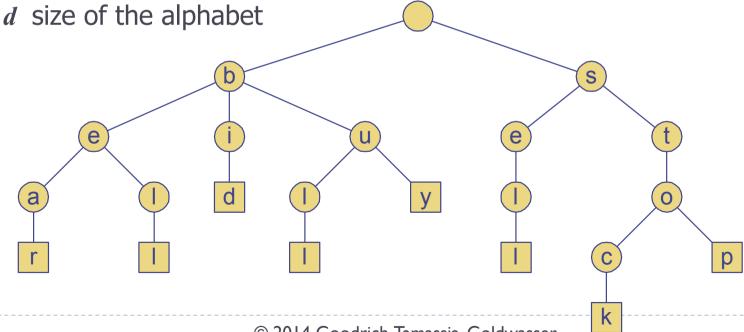

Analysis of Standard Tries

A standard trie uses O(n) space and supports searches, insertions and deletions in time O(dm), where:

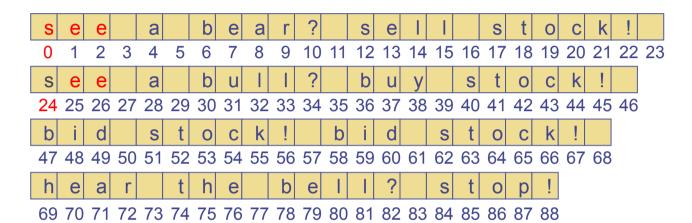

n total size of the strings in S

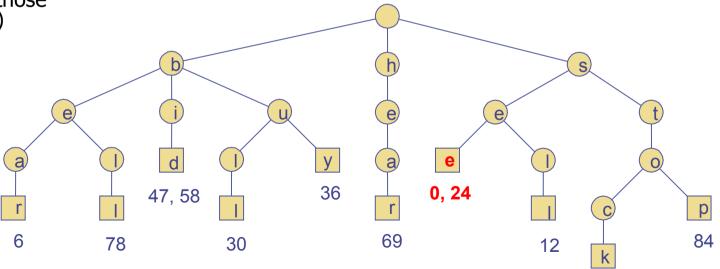

m size of the string parameter of the operation

Word Matching with a Trie

- insert the words of the text into trie
- Each leaf is associated w/ one particular word
- leaf stores indices where associated word begins ("see" starts at index 0 & 24, leaf for "see" stores those indices)

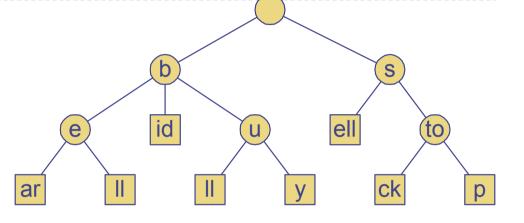

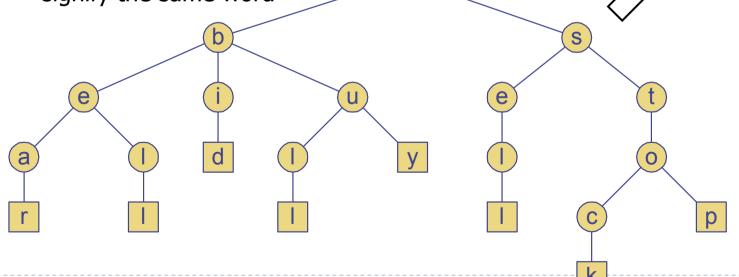

Compressed Tries

- A compressed trie has internal nodes of degree at least two
- It is obtained from standard trie by compressing chains of "redundant" nodes

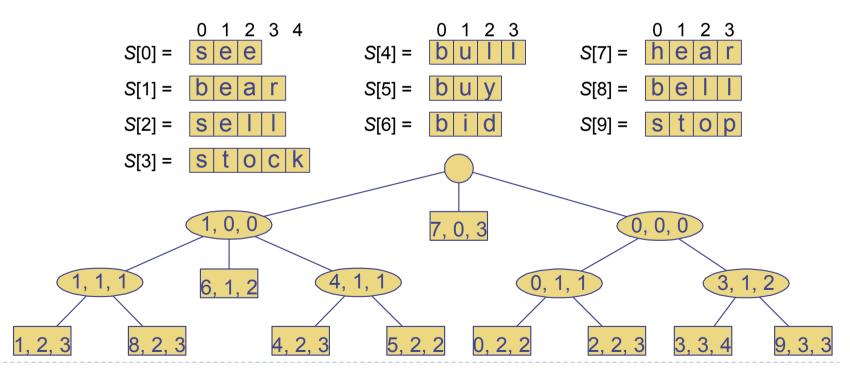

ex. the "i" and "d" in "bid" are "redundant" because they signify the same word

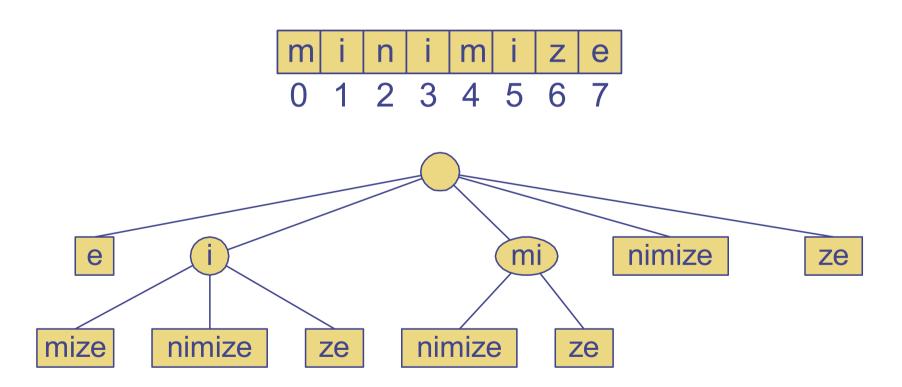

Compact Representation

- Compact representation of a compressed trie for an array of strings:
 - Stores at the nodes ranges of indices instead of substrings
 - Uses O(s) space, where s is the number of strings in the array
 - Serves as an auxiliary index structure

Suffix Trie

lacktriangleright The suffix trie of a string X is the compressed trie of all the suffixes of X

Analysis of Suffix Tries

- Compact representation of the suffix trie for a string X of size n from an alphabet of size d
 - Uses O(n) space
 - Supports arbitrary pattern matching queries in X in O(dm) time, where m is the size of the pattern
 - ightharpoonup Can be constructed in O(n) time
